

# savvius Spotlight™

Our new version of Savvius Spotlight software significantly increases network performance analysis, while adding enhanced application analysis and configurable analytic dashboards.

## What's New in Savvius Spotlight

- **Improved real-time network performance analysis**

New software and appliance significantly increases Spotlight real-time network performance analysis to more than 35 Gbps in a 1RU appliance.

- **New predefined application analysis**

Immediately see the performance of SaaS applications used on your network, like Office365 or Citrix, across your whole network or for a single user, or even drill into the specific services, like Skype.

- **New user-defined application analysis**

Most enterprises have their own custom applications, and many have hundreds or more. Spotlight lets you define your unique applications, and track them for key performance issues.

- **Updated and user-defined analytic dashboards**

Completely customizable displays and analytic panes let you set up the main screen in Spotlight to feature the conversation data and analysis most important to you, whether by application, analytic, or network segment.
